

Heap Sort Analysis

Analysis of the algorithm:

1. Time Complexity:

Building the max-heap

Extracting elements and heapifying

Overall Time Complexity

2. Space Complexity:

The algorithm is in-place as it uses the input array for sorting.

Space Complexity

3. Properties:

It is a comparison-based sorting algorithm.

It is not stable because the order of equal elements might change.

Kruskal's Analysis

Time Complexity:

Sorting edges: $O(E \log E)$, where E is the number of edges.

Union-Find operations: $O(E \alpha(V))$, where α is the inverse Ackermann function.

Overall Time Complexity: $O(E \log E + E \alpha(V))$

2. Space Complexity:

Space Complexity: $O(E + V)$, for storing edges and disjoint sets.
